

HUNTER POWELL

hunterpowell99@gmail.com • github.com/hunterpowell • hunterpowell.dev • 801-712-0183

EDUCATION

California State University, Sacramento - B.S. Computer Science (Expected December 2026) GPA: 3.5

Relevant Courses: Machine Learning, Parallel Computing, Networking, Operating Systems

Folsom Lake College – A.S. Computer Science (2020-2023)

TECHNICAL SKILLS

- **Languages:** Python, C++, CUDA, Java, JavaScript, Rust, TypeScript
- **Frameworks/Tools:** Django, OpenMP, CMake, Numpy, Pandas, scikit-learn, Git, Axum, Tokio
- **Databases/Other:** MySQL, Django ORM, schema design, Git

PROFESSIONAL EXPERIENCE

Software Engineer — Lydia's Law | Sacramento, CA

2025-2026

Senior capstone; team-sourced client engagement

- Built and shipped a full-stack Django site for a family law practice with an 8-person team over 8 months; deployed to production March 2026, maintained through May, then handed off. Still live at adoptionofsac.com.
- Built the admin dashboard and a WYSIWYG content editor letting non-technical staff edit site content directly, eliminating developer involvement in routine updates.
- Migrated site content from hardcoded templates into a normalized MySQL schema and wired the editor to it, refactoring Django templates to render dynamically from the database.
- Co-authored 200+ pages of documentation across a test plan, maintenance manual, and end-user manual; owned formatting and completion of the maintenance and user manuals, coordinating an 8-person team's contributions into deliverables for QA, future maintainers, and non-technical staff.

PROJECTS

Genetic Algorithm - C++, OpenMP, Python

github.com/hunterpowell/GeneticAlg

- Evolved movement policies for the "coverage problem": a limited-energy robot exploring an unknown grid, with each agent's behavior encoded as 32 conditional genes mapping perceived N/E/S/W neighbor states to a movement direction.
- Applied elitism, tournament selection, uniform crossover, and random mutation across 500-agent generations; robots independently converged on a boustrophedon row-sweep consistently achieving >90% average map coverage.
- Parallelized evaluation and repopulation with OpenMP for a 27x speedup (138s → 5s) on 500-agent, 500-generation runs.

Slate Virtual Tabletop – Rust, Axum, Tokio, TypeScript

github.com/hunterpowell/SlateVTT

- Real-time multiplayer virtual tabletop replacing Foundry VTT for an active 6-player D&D group: shared map, per-owner token permissions, initiative tracking, and fog of war, self-hosted with room state persisted as a JSON snapshot instead of a database.
- Architected the server as a single-owner room actor on Tokio so all mutations serialize through one task owning RoomState, with every outbound WebSocket message filtered per recipient — hidden monsters, monster HP, and unexplored map never reach a player's client.
- Implemented server-authoritative visibility from DM-traced walls and doors: line of sight recomputed per player each move and unioned into remembered explored area, with a DM override to reveal or black out regions by hand.

WORK EXPERIENCE

Barista | Starbucks | 2018–2019

Automotive Technician | Havoline Xpress Lube | 2015–2017

- Acted as senior technician among peers for the final year, informally mentoring newer hires and serving as the go-to for complex diagnostics.
