Sacramento, CA • Open to relocation and remote • linkedin.com/in/hunterpowell-dev

## EDUCATION

**California State University, Sacramento** – B.S. Computer Science (December 2026)

GPA: 3.5

Relevant Courses: Machine Learning, Parallel Computing, Networking, Operating Systems

**Folsom Lake College** – A.S. Computer Science (2020-2023)

## TECHNICAL SKILLS

- **Languages:** Python, C++, CUDA, Java, Rust, TypeScript
- **Frameworks/Tools:** Django, OpenMP, CMake, NumPy, Pandas, scikit-learn, Git
- **Databases/Other:** MySQL, Django ORM

## PROFESSIONAL EXPERIENCE

**Software Engineer — Lydia's Law** | Sacramento, CA | adoptionsofsac.com

2025-2026

*Senior capstone; team-sourced client engagement*

- Built and shipped a full-stack Django site for a family law practice with an 8-person team over 8 months; deployed to production March 2026 with 90% test coverage, maintained through May, then handed off.
- Worked in two-week sprints that ended in a demo and feedback session with the client. Turned a non-technical client's requests into scoped features for the next sprint, supported by weekly team meetings and daily async standups.
- Built an admin dashboard and visual content editor so non-technical staff can update the site themselves. Moved content out of hardcoded templates into a MySQL database and rewrote templates to render from it.
- Co-authored 200+ pages of documentation (test plan, maintenance manual, end-user manual) and owned final formatting and completion of the maintenance and user manuals.

## PROJECTS

**Genetic Algorithm** – C++, OpenMP, Python

[github.com/hunterpowell/GeneticAlg](https://github.com/hunterpowell/GeneticAlg)

- Used a genetic algorithm to evolve movement strategies for a simulated robot with limited energy exploring an unknown grid. Each robot's behavior was 32 rules mapping what it sees in neighboring cells to which way it moves.
- Applied elitism, tournament selection, uniform crossover, and random mutation across 500-agent generations; robots independently converged on a boustrophedon (back-and-forth) row-sweep consistently achieving >90% average map coverage.
- Parallelized evaluation and repopulation with OpenMP for a 27x speedup (138s → 5s) over 500 generations

**Slate Virtual Tabletop** – Rust, Axum, Tokio, TypeScript

[github.com/hunterpowell/SlateVTT](https://github.com/hunterpowell/SlateVTT)

- Built a real-time multiplayer virtual tabletop that replaced Foundry VTT for my 6-player D&D group, self-hosted on a Raspberry Pi alongside a second instance that another DM runs for a separate group. It has shared maps, per-player token control, initiative tracking, and fog of war, and saves game state to a JSON file instead of a database.
- Made the server decide what each player can see: it recalculates line of sight from DM-drawn walls and doors after every move, remembers explored areas, and never sends hidden information to the client.
- Built a verification harness (500+ Rust server tests, TypeScript canvas tests, headless-browser checks) that every AI-assisted change must pass before merge, holding generated code to the same spec as hand-written code.

## ADDITIONAL EXPERIENCE

**Barista** | Starbucks | 2018–2019

- Handled shift-lead duties on evening shifts, including closing, cash handling, and coordinating coverage.

**Automotive Technician** | Havoline Xpress Lube | 2015–2017

- Acted as senior technician for the final year, mentoring newer hires and serving as the go-to for complex diagnostics.
